Generic3 model

Parametrization

The generic3 model implements the following precision matrix

$$\mathbf{Q} = \tau_{\text{common}} \sum_{i=1}^{m} \tau_i \boldsymbol{R}_i, \qquad 1 < m \leq 10, \tag{1}$$

where each $\boldsymbol{R}_i \geq 0$, and τ_i is the specific precision parameter and τ_{common} is a shared one.

Hyperparameters

The hyperparameters are defined as

$$\theta_i = \log(\tau_i), \qquad i = 1, 10$$

and

$$\theta_{11} = \log(\tau_{\text{common}})$$

and priors are assigned to $(\theta_1, \theta_2, \ldots)$.

Specification

The generic3 model is specified inside the `f()` function as

```
f(<whatever>, model="generic3", Cmatrix = <list.of.Cmat>, hyper = <hyper>)
```

where `<list.of.Cmat>` a list of length m (maximum 10) of $\boldsymbol{R}_i$-matrices. By default, θ_j for $j = m+1, \ldots, 11$ is set to fixed (this includes τ_{common}).

Hyperparameter spesification and default values
