Correlated random effects: `iid1d`, `iid2d`, `iid3d`, `iid4d` and `iid5d`

This model is available for dimensions $p = 1$, 2, 3, 4 and 5. We describe in detail the case for $p = 2$, and then the changes required for $p = 1$, $p = 3$, $p = 4$ and $p = 5$

Parametrization

The 2-dimensional Normal-Wishard model is used if one want to define two vectors of "random effects", u and v, say, for which (u_i, v_i) are iid bivariate Normals

$$\begin{pmatrix} u_i \\ v_i \end{pmatrix} \sim \mathcal{N}\left(\mathbf{0}, \mathbf{W}^{-1}\right)$$

where the covariance matrix $\mathbf{W}^{-1}$ is

$$\mathbf{W}^{-1} = \begin{pmatrix} 1/\tau_a & \rho/\sqrt{\tau_a \tau_b} \\ \rho/\sqrt{\tau_a \tau_b} & 1/\tau_b \end{pmatrix} \tag{1}$$

and τ_a, τ_b and ρ are the hyperparameters.

Note that ρ is the correlation coefficient, and that τ_a and τ_b are the *marginal precisions*, *not* the elements in the precision matrix.

For these models the precision matrix $\mathbf{W}$ is Wishart distributed

$$\mathbf{W} \sim \text{Wishart}_p(r, \mathbf{R}^{-1}), \quad p = 2$$

with density

$$\pi(\mathbf{W}) = c^{-1} |\mathbf{W}|^{(r-(p+1))/2} \exp\left\{-\frac{1}{2}\text{Trace}(\mathbf{W}\mathbf{R})\right\}, \quad r > p + 1$$

and

$$c = 2^{(rp)/2} |\mathbf{R}|^{-r/2} \pi^{(p(p-1))/4} \prod_{j=1}^{p} \Gamma((r + 1 - j)/2).$$

Then,

$$\text{E}(\mathbf{W}) = r\mathbf{R}^{-1}, \quad \text{and} \quad \text{E}(\mathbf{W}^{-1}) = \mathbf{R}/(r - (p + 1)).$$

Hyperparameters

The hyperparameters are

$$\theta = (\log \tau_a, \log \tau_b, \tilde{\rho})$$

where

$$\rho = 2\frac{\exp(\tilde{\rho})}{\exp(\tilde{\rho}) + 1} - 1$$

The prior-parameters are

$$(r, R_{11}, R_{22}, R_{12})$$

where

$$\mathbf{R} = \begin{pmatrix} R_{11} & R_{12} \\ R_{21} & R_{22} \end{pmatrix}$$

and $r_{12} = R_{21}$ due to symmetry.

The `inla` function reports posterior distribution for the hyperparameters τ_a, τ_b, ρ in equation (1).

The prior for θ is **fixed** to be `wishart2d`

Specification

The model `iid2d` is specified as

```
y ~ f(i, model="iid2d",n = <length>) + ...
```

and the `iid2d` model is represented internally as one vector of length n,

$$(u_1, u_2, \ldots, u_m, v_1, v_2, \ldots, v_m)$$

where $n = 2m$, and n is the (required) argument in `f()`.

For this model the argument `constr=TRUE` is interpreted as

$$\sum u_i = 0, \qquad \text{and} \qquad \sum v_i = 0.$$

Example

In these examples we demonstrate the use of the iid2d-model, with observations that are without noise (essentially).

```
n = 1000
N = 2*n

## need it to simulate data
library(mvtnorm)

if (TRUE)
{
    ## first example - each variable in the correlated pair has its own row in data

    #Using fixed covariance matrix
    rho = 0.5
    ## set variances
    Sigma = matrix(c(1/1, NA, NA, 1/2), 2, 2)
    ## and the correlation
    Sigma[1,2] = Sigma[2,1] = rho*sqrt(Sigma[1,1]*Sigma[2,2])

    y = yy = rmvnorm(n, sigma=Sigma)
    y = c(y[,1], y[,2])

    i = 1:N
    formula = y ~ f(i, model="iid2d", n=N)

    r = inla(formula, data = data.frame(i,y),
            control.family=list(initial=10,fixed=TRUE))
```

```
    print(summary(r))

    print(1/diag(cov(yy)))
    print(cor(yy)[1,2])
}

if (TRUE)
{
    ## second example - both correlated variables occur in the same row of data

    #drawing covariance matrix from hyperprior
    #Let's specify non-default values, expecting strong covariance
    r = 4
    R11 = 5
    R22 = 4
    R12 = 3

    R = matrix(c(R11,R12,R12,R22), 2, 2)
    #Take a single sample from wishart_2(r,R^-1)
    W = rWishart(1,r,solve(R))[,,1]
    Sigma = solve(W) #Compute the covariance matrix

    y = yy = rmvnorm(n, sigma=Sigma)
    z = rnorm(n)
    zz = rnorm(n)
    y = y[,1] + z*y[,2] + zz
    i = 1:n
    j = n + 1:n
    formula = y ~ f(i, model="iid2d", n=N) + f(j,z,copy="i") + zz

    r = inla(formula, data = data.frame(i,j,y,z,zz),
            control.family=list(initial=10,fixed=TRUE),keep=T)
    print(summary(r))

    #The params as in the Sigma matrix
    print(1/diag(Sigma))
    print(cov2cor(Sigma)[1,2])

    #The params as seen in data
    print(1/diag(cov(yy)))
    print(cor(yy)[1,2])
}
```

The case $p = 1$

For $p = 1$ the hyperparameter is the marginal precision

$$\theta = \log \tau_1$$

The prior is fixed to be `wishart1d` with parameters

$$param = \; r \; R_{11}$$

where

$$\mathbf{R} = \left[\; R_{11} \; \right]$$

Notes

The model `iid1d` is similar to the model `iid` (and included for completeness only). The prior for `iid1d` is fixed to be Wishart-distributed, which reduces to a Gamma-distribution for the precision with parameters

$$a = r/2 \qquad \text{and} \qquad b = R_{11}/2$$

hence

```
y ~ f(i, model="iid1d", hyper = list(theta=list(param=c(3, 4))))
```

is equivalent to

```
y ~ f(i, model="iid", hyper = list(theta=list(param=c(1.5, 2), prior="loggamma")))
```
